GUIDE DE MODIFICATION

■ Guide de modification pour les broches d'éjection droites et étagées

| Article | Produits Applicables | Modifications | Code | Spécifications |
|---|------------------------------------|---|---|---|
|  Modification de la tête | Droites et Ejecteur Épaulée | Coupe plate de la clavette  | KC Coupe plate simple [Gamme de désignation] $D/2 \leq KC < H/2$ | Pour réaliser un plat à la position du diamètre de l'arbre  [Unité de désignation] Incréments de 0.05 mm possibles [Méthode de désignation] • KC0.75 (Lorsque D1.5) • WKC3.5 (Lorsque D7) La tolérance D est maintenue même si D/2 est désigné pour s'adapter au diamètre de l'arbre. Pour désigner une taille plate arbitraire  [Unité de désignation] Incréments de 0.1 mm uniquement [Méthode de désignation] • KC1.4 |
| | | Coupe plate de la clavette  | WKC Découpe de deux plats parallèles [Gamme de désignation] $D/2 \leq WKC < H/2$ | |
| | | Changement du diamètre de la tête  | HC Réduit le diamètre de la tête. [Gamme de désignation] $D + 1 \leq HC < H$ et $D \geq 1.5$ [Unité de désignation] Incréments de 0.1 mm [Méthode de désignation] HC6.5 | |
| | | Changement du diamètre de la tête (précision)  | HCC Réduit le diamètre de la tête. (Précision) [Gamme de désignation] $D + 1 \leq HCC < H - 0.3$ et $D \geq 1.5$ [Unité de désignation] Incréments de 0.1 mm [Méthode de désignation] HCC6.1 (JIS Type seulement) | |
| | | Changement de l'épaisseur de la tête  | TC Réduit l'épaisseur de la tête par rapport à la norme. La dimension L reste inchangée (sauf pour le type de pièce brute). [Gamme de désignation] $T/2 \leq TC < T$ (JIS Type seulement) | |

■ Guide de modification des lames d'éjecteur

| Article | Produits Applicables | Modifications | Code | Spécifications |
|--------------------------------|-------------------------|--|------------|---|
| Modification de la tête | Lames D'Éjecteur | Coupe plate de la clé (angulaire)  | AKC | Modifie la position plate dans le sens des aiguilles d'une montre à partir de la position standard (standard : 0°). [Gamme de désignation] $0 \leq AKC < 360$ [Unité de désignation] (AKC) [Méthode de désignation] $\theta = 0^\circ \dots AKC0$ incréments de 45° incréments de 1° $\theta = 45^\circ \dots AKC45$ |
| | | Coupe plate de la clé (angulaire)  | AWC | Ajoute deux plats parallèles à la position standard (0°), ou à l'angle désigné (dans le sens des aiguilles d'une montre, par incréments de 1° à partir de la position standard). [Gamme de désignation] $0 \leq AWC < 360$ [Unité de désignation] incréments de 1° [Méthode de désignation] $\theta = 0^\circ \dots AWC0, \theta = 45^\circ \dots AWC45$ |
| | | Coupe plate de la clé (angulaire)  Position standard | ARC | Ajoute deux méplats à angle droit à la position standard (0°), ou à l'angle désigné (dans le sens des aiguilles d'une montre, par incréments de 1° à partir de la position standard). [Gamme de désignation] $0 \leq ARC < 360$ [Unité de désignation] incréments de 1° [Méthode de désignation] $\theta = 0^\circ \dots ARC0, \theta = 45^\circ \dots ARC45$ |
| | | Coupe plate de la clé (angulaire)  Position standard | ADC | Ajoute trois méplats à la position standard (0°), de plus à l'angle désigné (dans le sens des aiguilles d'une montre, par incréments de 1° par rapport à la position standard). [Gamme de désignation] $0 \leq ADC < 360$ [Unité de désignation] incréments de 1° [Méthode de désignation] $\theta = 0^\circ \dots ADC0, \theta = 45^\circ \dots ADC45$ |

■ Guide for guide pillars & bushings

Guide pillars and bushings are guide components used for accurately positioning movable molds and fixed molds. If the cavity is not accurately aligned when the mold is closed, the molded components such as the core may be damaged.

Usually, four sets of guide pillars are installed at the four corners of the movable mold, and the guide bushings are placed at the relative positions of the fixed mold, but sometimes the guide pillars and the guide bushings are reversely mounted depending on the mold structure.

If they are used in combination with positioning components (tapered positioning pins, tapered positioning blocks, etc.), the alignment of the cavity will be more precise.

■ Guide pillar

MISUMI guide pillars are classified as head type and straight type.

The guide pillar and the mold plate are usually fixed by an interference fit, so the fixed portion at the root of the guide pillar is set to a positive tolerance. The guide pillar and the guide bushing usually have relative movement by a clearance fit, so the outer diameter dimension of the guide pillar working surface is set to a negative tolerance. In order to smoothly insert the guide pillar into the guide bushing during mold closing, MISUMI guide pillar also has a guidance portion at the top corner, which is composed of a tapered surface and an R angle.

■ Bushing

MISUMI guide bushings are classified as head type and straight type.

The guide bushing and the mold plate are usually fixed by an interference fit. Therefore, the outer diameter dimension tolerance of the guide bushing is set to a positive tolerance. The guide bushing and the guide pillar usually have relative movement by a clearance fit, so the inner diameter dimension of the guide bushing working surface is set to a negative tolerance.

■ Features of block sets

■ Usage

- Contacting the pin and bushing when mold is closed may cause damage. Please leave a clearance of about 0.5mm on PL.

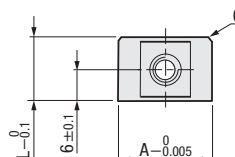

- The block sets are capable of offsetting the plate's thermal expansion caused in high temperature molding process for thermosetting resins, etc., thereby maintaining positioning accuracy. The pin type positioning method cannot thoroughly absorb thermal expansion when it takes place in directions as shown in the figure above. The block type will be unaffected if the groove direction is in parallel to the directions of thermal expansion as shown in the drawing above.

Example

■ Features

- Suitable for positioning in precision molds such as connector and electronic device.
- It is capable of preventing wear and damage in core pins since it can be positioned before core pins and such are inlaid on cavity.
- Positioning is easily performed by simultaneously processing plates in piles (refers to drawing on the right).
- Use precision leader pins since clearance is fairly small.
- There are lubricant coating on the sliding part of the side block sets and on both sides of the pin.
- The oil grooves that oil is fed to the sliding part, thus preventing the straight locating block set from scuffing or seizing.

■ Usage

- Contacting the pin and bushing when mold is closed may cause damage. Please leave a clearance of about 1mm on PL.

A relatively large sized mold can be positioned more precisely using 2 of the block set at each side in longitudinal direction of the mold base.
